

Amendment and Response

Applicant: John L. Manuel et al.

Serial No.: 10/702,151

Filed: November 5, 2003

Docket No.: 200300161-1

Title: SYSTEM AND METHOD FOR CREATING A BEST-MATCH OBJECT AT RUN TIME

IN THE CLAIMS

Please cancel claims 21 and 22 without prejudice.

Please add claims 45-49.

Please amend claims 20, 34, and 40 as follows:

1. (Original) A method for creating a best-match object at run time, comprising the steps of:
 - receiving a request for an object;
 - polling object proxies for a confidence level representing the capability of each respective proxy to generate the requested object;
 - selecting one of the proxies based on the polled confidence level; and
 - directing the selected proxy to create the object.
2. (Original) The method of claim 1, wherein the step of receiving a request for an object comprises receiving indicia of a peripheral device.
3. (Original) The method of claim 2, wherein indicia comprises a device identifier.
4. (Original) The method of claim 1, wherein the step of selecting one of the proxies comprises comparing each confidence level with a previously received confidence level.
5. (Original) The method of claim 1, wherein the step of selecting one of the proxies comprises storing an index associated with a proxy having a greater confidence level.
6. (Original) The method of claim 1, wherein the step of directing the select one of the proxies to create the object generates a peripheral device driver.
7. (Original) The method of claim 1, further comprising the step of:
 - registering a new proxy capable of creating an object designated for use with a new peripheral device.

Docket No.: 200300161-1

Title: SYSTEM AND METHOD FOR CREATING A BEST-MATCH OBJECT AT RUN TIME

8. (Previously Presented) A system, comprising an object generator and a processor operable to execute the object generator, the object generator including instructions that when executed by the processor function as:

means for receiving indicia of an object to be created;

means for identifying a select one of a plurality of object proxies responsive to a respective confidence level associated with each object proxy; and

means for directing the selected object proxy to create the object.

9. (Previously Presented) The system of claim 8, wherein the means for receiving is responsive to a user interface.

10. (Previously Presented) The system of claim 8, wherein the means for receiving is responsive to a communication from a device associated with the object.

11. (Previously Presented) The system of claim 8, wherein the means for identifying a select one of a plurality of object proxies comprises means for comparing each respective confidence level with a previously received confidence level.

12. (Previously Presented) The system of claim 8, wherein the means for identifying a select one of a plurality of object proxies comprises means for comparing each confidence level with a maximum confidence level.

13. (Previously Presented) The system of claim 12, wherein the means for identifying a select one of a plurality of object proxies identifies an object proxy that returns the maximum confidence level as the selected object proxy.

14. (Previously Presented) A system, comprising an object generator and a processor operable to execute the object generator, the object generator including instructions that when executed by the processor function as:

an object factory configured to poll object proxies capable of producing respective objects responsive to system needs; and

Title: SYSTEM AND METHOD FOR CREATING A BEST-MATCH OBJECT AT RUN TIME

a pool including the object proxies for producing the object, the pool configured to receive indicia of the object from the object factory and each of the plurality of object proxies configured to return a respective confidence level responsive to the indicia.

15. (Previously Presented) The system of claim 14, further comprising:
an interface associated with the object factory, the interface configured to receive a request for the object.
16. (Previously Presented) The system of claim 15, wherein the interface is configured to communicate with a user interface.
17. (Previously Presented) The system of claim 15, wherein the interface is configured to communicate with a device that will interact with the object.
18. (Previously Presented) The system of claim 15, wherein the interface is configured to receive a device identifier.
19. (Previously Presented) The system of claim 15, wherein the interface is configured to receive a device identifier associated with a printer.
20. (Currently Amended) ~~The system of claim 14~~ A system, comprising an object generator and a processor operable to execute the object generator, the object generator including instructions that when executed by the processor function as:
an object factory configured to poll object proxies capable of producing respective objects responsive to system needs; and
a pool including the object proxies for producing the object, the pool configured to receive indicia of the object from the object factory and each of the plurality of object proxies configured to return a respective confidence level responsive to the indicia,
wherein the object factory comprises a comparator configured to determine which of a first confidence level associated with a first object proxy and a second confidence level

Docket No.: 200300161-1

Title: SYSTEM AND METHOD FOR CREATING A BEST-MATCH OBJECT AT RUN TIME

associated with a second object proxy is more likely to produce an object most responsive to the system need,

wherein when the comparator recognizes a maximum confidence level, the object factory is configured to direct the object proxy associated with the maximum confidence level to create an object, and

wherein when the comparator fails to recognize a maximum confidence level, the object factory is configured to direct the object proxy associated with the greatest confidence level to create an object.

21-22. (Cancelled)

23. (Previously Presented) The system of claim 14, further comprising:
an object store configured to receive an object generated by an object proxy.

24-30. (Cancelled)

31. (Previously Presented) A system, comprising an object generator and a processor operable to execute the object generator, the object generator including instructions that when executed by the processor function as:

an object factory configured to receive a device identifier;

a pool having an interface configured to communicate with the object factory, the pool containing object proxies capable of producing respective objects; and

an object store coupled to the pool and configured to receive and retain objects generated by selected object proxies;

wherein the object factory is configured to poll a plurality of object proxies for a confidence level representing the capability of the respective object proxy to generate an object suited for operating with a device responsive to the device identifier.

32. (Cancelled)

Serial No.: 10/702,151

Filed: November 5, 2003

Docket No.: 200300161-1

Title: SYSTEM AND METHOD FOR CREATING A BEST-MATCH OBJECT AT RUN TIME

33. (Original) A method for creating a best-match object at run time, comprising the steps of:

- loading a set of object proxies;
- receiving indicia of a desired object for communicating with a peripheral device;
- directing each of the object proxies to forward a confidence level representing the capability of each respective proxy to generate the desired object responsive to the indicia;
- receiving a confidence level associated with an object proxy;
- comparing the confidence level to a maximum confidence level, when the confidence level matches the maximum confidence level, directing the associated object proxy to generate an object, otherwise, recording the confidence level; and

- determining if the confidence level exceeds the confidence level associated with a previously recorded confidence level, when the confidence level exceeds a previously recorded confidence level, recording an object proxy identifier, otherwise, determining if there are additional object proxies in the set, when there are additional object proxies, repeating the receiving a confidence level, comparing, and determining if the confidence level exceeds steps, otherwise, using the object proxy identifier to direct the associated object proxy to generate an object.

34. (Currently Amended) A computer-readable medium storing instructions executable by a processor, the instructions comprising:

- logic configured to load a set of object proxies, each object proxy configured to generate a respective object;

- logic configured to receive indicia of a desired object for communicating with a peripheral device;

- logic configured to direct each of the object proxies to forward a confidence level representing the capability of each respective proxy to generate the desired object;

- logic configured to receive the confidence level from respective object proxies;

- logic configured to compare the confidence level to a maximum confidence level, when the confidence level matches the maximum confidence level, the associated object proxy is directed to generate an object, otherwise, the logic records the confidence level; and determines if the confidence level exceeds the confidence level associated with a previously

recorded confidence level, when the confidence level exceeds a previously recorded confidence level, the logic records an object proxy identifier, otherwise, the logic determines if there are additional object proxies in the set, when there are additional object proxies, the logic receives a confidence level associated with an object proxy that has not reported a confidence level, and repeats the maximum confidence level and previously recorded confidence level comparisons, otherwise, the logic uses the object proxy identifier to direct the associated object proxy to generate an object.

35. (Original) A method for creating a best-match printer driver, comprising the steps of:
receiving a request to use a printer;
polling printer driver proxies for a confidence level representing the capability of each respective printer driver proxy to generate a driver that when applied to data and forwarded to the printer will produce a useful representation of the data;
selecting one of the printer driver proxies based on the polled confidence level; and
directing the selected printer driver proxy to generate the driver.
36. (Original) The method of claim 35, wherein the step of receiving a request to use a printer comprises receiving a device identifier.
37. (Original) The method of claim 35, wherein the step of receiving a request to use a printer comprises receiving indicia of a printer capability.
38. (Original) The method of claim 35, wherein the step of selecting one of the printer driver proxies comprises comparing each confidence level with a previously received confidence level.
39. (Original) The method of claim 35, wherein the step of selecting one of the printer driver proxies comprises storing an index associated with a printer driver proxy having a greater confidence level.

Docket No.: 200300161-1

Title: SYSTEM AND METHOD FOR CREATING A BEST-MATCH OBJECT AT RUN TIME

40. (Currently Amended) A computer-readable medium storing instructions executable by a processor, the instructions comprising:

logic configured to receive a request to use a printer;

logic configured to poll printer driver proxies for a confidence level representing the capability of each respective printer driver proxy to generate a driver that when applied to data and forwarded to the printer will produce a useful representation of the data;

logic configured to select one of the printer driver proxies based on the polled confidence level; and

logic configured to direct the selected printer driver proxy to generate the driver.

41. (Original) The computer-readable medium of claim 40, wherein the logic configured to receive a request to use a printer is configured to receive a device identifier.

42. (Original) The computer-readable medium of claim 40, wherein the logic configured to receive a request to use a printer is configured to receive indicia of a printer capability.

43. (Original) The computer-readable medium of claim 40, wherein the logic configured to select one of the printer driver proxies is configured to compare confidence levels with a previously received confidence level.

44. (Original) The computer-readable medium of claim 40, wherein the logic configured to select one of the printer driver proxies is configured to store an index associated with a printer driver proxy having a greater confidence level.

45. (New) The method of claim 1, wherein the step of selecting one of the proxies comprises determining which of a first confidence level associated with a first object proxy and a second confidence level associated with a second object proxy is more likely to produce an object most responsive to a system need,

wherein when a maximum confidence level is recognized, directing the object proxy associated with the maximum confidence level to create the object, and

wherein when a maximum confidence level is failed to be recognized, directing the object proxy associated with the greatest confidence level to create the object.

46. (New) The system of claim 8, wherein the means for identifying a select one of a plurality of object proxies comprises means for determining which of a first confidence level associated with a first object proxy and a second confidence level associated with a second object proxy is more likely to produce an object most responsive to a system need,

wherein when a maximum confidence level is recognized, means for directing the object proxy associated with the maximum confidence level to create the object, and

wherein when a maximum confidence level is failed to be recognized, means for directing the object proxy associated with the greatest confidence level to create the object.

47. (New) The system of claim 31, wherein the object factory comprises a comparator configured to determine which of a first confidence level associated with a first object proxy and a second confidence level associated with a second object proxy is more likely to produce an object most responsive to the system need,

wherein when the comparator recognizes a maximum confidence level, the object factory is configured to direct the object proxy associated with the maximum confidence level to create the object, and

wherein when the comparator fails to recognize a maximum confidence level, the object factory is configured to direct the object proxy associated with the greatest confidence level to create the object.

48. (New) The method of claim 35, wherein the step of selecting one of the printer driver proxies comprises:

comparing the confidence level to a maximum confidence level, wherein when the confidence level matches the maximum confidence level, directing the associated printer driver proxy to generate the driver, otherwise, recording the confidence level; and

determining if the confidence level exceeds the confidence level associated with a previously recorded confidence level, wherein when the confidence level exceeds the previously recorded confidence level, recording an identifier of the printer driver proxy,
